2006 Annual Survey of the Mathematical Sciences in the United States

(Second Report)

Updated Report on the 2005–2006 Doctoral Recipients Starting Salary Survey of the 2005–2006 Doctoral Recipients

Polly Phipps, James W. Maxwell, and Colleen A. Rose

Update on the 2005–2006 Doctoral Recipients

Introduction

The Annual Survey of the Mathematical Sciences collects information each year about degree recipients, departments, faculties, and students in the mathematical sciences at four-year colleges and universities in the United States, Information about recipients of doctoral degrees awarded between July 1, 2005, and June 30, 2006, was collected from doctorate-granting departments beginning in late spring 2006. The "2006 Annual Survey First Report" (Notices, February 2007, pages 252-67) presented survey results about 1,245 new doctoral recipients based on the data provided by the departments. Here we update this information using data obtained from 660 new doctoral recipients who responded to a questionnaire, Employment Experiences of New Doctoral Recipients (EENDR), sent in early October 2006 to all new doctoral recipients. In addition, this report incorporates information on an additional 66 doctoral recipients from departments that responded too late to have the information included in the First Report. Finally, we present the starting salaries and other employment information from the new doctoral recipients that responded to the EENDR questionnaire.

The names and thesis titles of the 2005–2006 doctoral recipients reported on in the First Report were published in "Doctoral Degrees Conferred" (*Notices*, February 2007, pages 277–97). A supplemental listing of the 66 additional new

This Second Report of the 2006 Annual Survey gives an update of the 2005–2006 new doctoral recipients from the First Report, which appeared in the *Notices of the AMS* in February 2007, pages 252–67. The First Report gave salary data for faculty members in these same departments. It also had a section on new doctoral recipients in statistics that is not updated here.

The 2006 Annual Survey represents the fiftieth in an annual series begun in 1957 by the American Mathematical Society. The 2006 Survey is under the direction of the Data Committee, a joint committee of the American Mathematical Society, the American Statistical Association, the Institute of Mathematical Statistics, the Society of Industrial and Applied Mathematics, and the Mathematical Association of America. The current members of this committee are Richard Cleary, Amy Cohen-Corwin, Richard M. Dudley, John W. Hagood, Abbe H. Herzig, Donald R. King, David J. Lutzer, James W. Maxwell (ex officio), Bart Ng, Polly Phipps (chair), David E. Rohrlich, and Henry Schenck. The committee is assisted by AMS survey analyst Colleen A. Rose. Comments or suggestions regarding this Survey Report may be directed to the committee.

doctoral recipients appears at the end of this report on pages 888-89.

Updated Employment Status of 2005–2006 Doctoral Recipients

The updated responses rates for the 2006 Survey of New Doctoral Recipients appear on the next page. The total number of departments responding in time for inclusion in this Second Report was 269, 24 more than were included in the 2006 First Report and 7 more than the number responding for

Polly Phipps is a senior research statistician with the Bureau of Labor Statistics. James W. Maxwell is AMS associate executive director for special projects. Colleen A. Rose is AMS survey analyst.

Highlights

There were 1,311 doctoral recipients from U.S. institutions for 2005–2006, up 89 (7%) from the previous year. This is the highest number of new Ph.D.'s ever reported.

The final unemployment rate for 2005–2006 doctoral recipients was 3.3%, the lowest percentage reported since 2002.

The number of new doctoral recipients who are not U.S. citizens is 759, up 33 over last year's number, and up 227 (43%) from 2001–2002.

The number of new doctoral recipients who are U.S. citizens is 552, up 56 (11%) from last year's number; this is the highest number of U.S. citizens reported since 1999-2000 when it was 566. The percentage of U.S. citizens among all doctoral recipients this year is 42%, up from 41% last year.

Females totaled 422 (32%) of all new doctoral recipients, up in number and percentage from 359 (29%) last year. Of the 552 U.S. citizen new doctoral recipients, 153 are female (28%), up in number and the same percent from last year. The highest percentage of females among the annual counts of doctoral recipients was 34%, reported for 1998–1999.

The number of doctoral recipients whose employment status is unknown is 163, up 13 from last year's number of 150.

Of the 1,148 new doctoral recipients whose employment status is known, 1,099 reported having employment in fall 2006 with 87% (958) finding employment in the U.S.; last year this percentage was 86%.

The number of new doctoral recipients taking positions in U.S. business/industry and government was 243 in fall 2006, a 38% increase from last year's number. The percentage of doctoral recipients employed in the U.S. taking positions in business/industry and government has increased to 25%, from 20% in fall 2005. This is the highest number and percentage reported since 2002 when it was 179 (24%).

The number of new doctoral recipients hired into U.S. academic positions in fall 2006 is 715. This is the highest such number reported over the past twenty-five years. Indeed, each of the numbers reported for the past three falls exceeds any number reported during the period from fall 1982 through fall 2003.

Non-U.S. citizens accounted for 58% of those employed in the U.S. (last year this percentage was 59%).

There were 660 new doctoral recipients responding to the EENDR survey; of the 563 who found employment in the U.S., 51% reported obtaining a permanent position (down from 56% in fall 2005).

The percentage of temporarily employed respondents who reported taking a postdoctoral position in the U.S. increased from 172 (74%) in fall 2005 to 209 (76%) in fall 2006.

2004-2005	1116	1222
2005-2006	1245	1311

doctoral recipients in the mathematical sciences awarded by U.S. institutions in each year from 1996 through 2006. This year the total number of new doctoral recipients is 1,311, up from the previous year by 89. A detailed review of responding and non-responding departments indicates that the increase in doctoral recipients from 2005 to 2006 is not significantly influenced by differences in department response patterns.

Table 1B shows trends in the number of new doctoral recipients for the past five years broken down by U.S. citizens and non-U.S. citizens. This year the number of new doctoral recipients who are U.S. citizens is 552, an increase of 56 (11%) over last

year. The number of non-U.S. citizen new doctoral recipients rose to 759, a 5% increase over last year.

Table 1C gives a breakdown of the 1,311 doctoral degrees awarded in the mathematical sciences between July 1, 2005, and June 30, 2006, by type of degree-granting department.

Tables 2A, 2B, and 2C display updates of employmentdata, found in these same tables in the First Report, for the fall count of 2005–2006 doctoral recipients plus 66 additional doctoral recipients reported late. These tables are partitioned by field of thesis research, by the survey group of their degree-granting department, and by type of employer. New doctoral recipients are grouped by field of thesis using the *Mathematical Reviews* 2000 Mathematics Subject Classification list. A complete list of these groups is available on the AMS website at www.ams.org/employment/Thesis_groupings.pdf. At the time of this Second Report, the fall 2006

employment status of 1,148 of the 1,311 doctoral recipients was known.

The fall 2006 unemployment rate for new doctoral recipients, based on information gathered by the time of the Second Report, was 3.3%. Figure 1 presents the fall 1982 through fall 2006 trend in the final unemployment rate of new doctoral recipients. The counts on which these rates are determined do not include those new doctoral recipients whose fall employment status was unknown at the time of the Second Report. This year the number of recipients whose employment status was reported as unknown increased to 163 from 150 last year.

Of the 1,148 new doctoral recipients whose employment is known, 958 were employed in the U.S., 141 were employed outside the U.S., 38 were still seeking employment, and 11 were not seeking employment.

Table 2D presents the trend in the percentage of employed new doctoral recipients by type of employer for the last five years. Academic employment includes those employed by research institutes and other nonprofits. The percentage of the total employed new doctoral recipients that are in U.S. academic positions has dropped for the second consecutive year and concomitantly the percentage of the total employed in U.S. nonacademic positions (U.S. government, U.S. business and industry) has increased for the second consecutive year.

Among new doctoral recipients who are employed in the U.S., the percentage taking nonacademic employment varied significantly by field of thesis. For those whose field of thesis is in the first three columns in Table 2A, this percentage is the lowest at 10% (up from 7% last year), while the percentage for those with theses in probability or statistics is the highest at 40% (up from 36% last year).

Table 3A shows that the fall 2006 total number of doctoral recipients taking positions in business/industry and government is 243. This number reflects an increase of 38% over last year. All groups have

Table 3B: New Doctoral Recipients Employed in U.S. Academic Positions

female new doctoral recipients produced is highest in Group IV (47%). The total percentage of females produced and hired has increased from last year's percentages of 29% and 26%, respectively, to this year's 32% and 27%.

Updated Information about 2005–2006 Doctoral Recipients by Sex and Citizenship

Tables 3D and 3E show the sex and citizenship of the 1,311 new doctoral recipients and the fact that 958 new doctoral recipients found jobs in the U.S. this year. This is 83% of the 1,148 new doctoral recipients whose employment status was known and 87% of the 1,099 known to have jobs in fall 2006.

respectively.

Sex and citizenship are known for all of the 1,311 new doctoral recipients. The final count of new doctoral recipients who are U.S. citizens is 552

Table 3F: Number of New Doctoral Recipients Employed in the U.S. by Citizenship and Type of Employer

	CIT	CITIZENSHIP			
U.S. EMPLOYER	U.S.	Non-U.S.	TOTAL

Academic: M&B, Other	196	169	365		
Nonacademic	94	149	243		
TOTAL	437	521	958		

² Includes those whose status is reported as "unknown" or "still seeking employment".

Includes those whose status is reported as "unknown" or "still seeking employment".

(42%) (up from 41% last year). Pages 235–8 of the First Report present further information related to the citizenship of the 2005–2006 new doctoral recipients.

Of the 552 U.S. citizen new doctoral recipients reported for 2005–2006, 153 are female and 399 are male. Females accounted for 27% of the U.S. citizen total (down from 28% last year). The number of female U.S. citizens has increased by 12 from last year's count of 141, and the number of male U.S. citizens increased by 44 over last year's count of 355.

Table 3F shows that U.S. citizens accounted for 46% of those employed in the U.S. (up from 42% last year). U.S. academic doctoral departments, Groups I through Va, hired 42% U.S. citizens, while groups M, B, and all other academic departments hired 54% U.S. citizens (last year these percentages were 40% and 53%, respectively). U.S. citizens represented 39% of those hired into nonacademic positions (last year 41%). Among all the 958 new 2005–2006 doctoral recipients employed in the U.S., 25% took nonacademic employment (government or business and industry.) This percentage is up from 20% in 2004–2005 and from 17% in 2003–2004.

New Information from the EENDR Survey

Of the 1,245 new doctoral recipients reported in the First Report, the 1,209 whose addresses were known were sent the Employment Experiences of New Doctoral Recipients (EENDR) survey in October 2006, and 660 (55%) responded. The response rates varied considerably among the various subgroups of new doctoral recipients defined by their employment status as reported by departments. Among those who were employed the highest response rate, 63%, was from those employed in the U.S. academic, while the lowest, 45%, was from those in non-U.S. academic.

The EENDR gathered details on employment experiences not available through

departments. The remainder of this section presents additional information available on this

subset of the 2005-2006 doctoral recipients.

Table 4A gives the numbers and percentages of EENDR respondents taking permanent and temporary positions in the U.S for fall 2002 through fall 2006.

This year we see that among the 563 employed in the U.S., 289 reported obtaining a permanent position and 274 a temporary position. While these numbers both reflect an increase, the percentage of

Table 4A: Number (and Percentage) of Annual EENDR Respondents Employed in the U.S. by Job Status

		Employed in U.S.										
				Temporary		Unknown						
	Permanent	Temporary	Permanent	Postdo	Postdoctoral							
	Total	Total			Permanent not available

¹ Includes Research Institutes and other non-profits.

individuals taking permanent positions in 2006 has decreased to 51% from 56% in 2005, and the percentage of those taking temporary positions has increased to 49% from 44% (the highest reported since 51% in 2004). Of the 274 in temporary positions, 98 (36%) reported taking temporary employment because a suitable permanent position was not available, and 209 (76%) classified their

Figure 2: Age Distribution of 2005-2006 EENDR Respondents

position as postdoctoral. Of the 209 respondents taking positions they classified as postdoctoral, 57 (27%) reported that a suitable permanent position was not available.

Table 4B shows the employment trends of permanent and temporary positions broken down by sector for the last five years. Following last year's pattern the percentage of permanently employed EENDR respondents taking employment in academia and government has declined this year, and there was an offsetting increase in the proportion of permanently employed EENDR respondents taking positions in business and industry.

Among the 289 who reported obtaining a permanent position in the U.S. in fall 2006, 66% were employed in academia (including 1% in research institutes and other nonprofits), 4% in government, and 30% in business or industry. Women held 39% of the permanent positions.

Among the 274 individuals with temporary employment in the U.S. this year, 93% were employed in academia (including 9% in research institutes and other nonprofits), 5% in government, and 2% in business or industry.

Figure 2 gives the age distribution of the 647 new doctoral recipients who responded to this question. The median age of new doctoral recipients was 30 years, while the mean age was 32 years. The first and third quartiles were 28 and 33 years, respectively.

Previous Annual Survey Reports

The 2006 First Annual Survey Report was published in the *Notices* in the February 2007 issue. For the last full year of reports, the 2005 First, Second, and Third Annual Survey Reports were published in the *Notices* in the February, August, and December 2006 issues respectively. These reports and earlier reports, as well as a wealth of other information from these surveys, are available on the AMS website at www.ams.org/employment/surveyreports.html.

Starting Salary Survey of the 2005–2006 Doctoral Recipients

The starting salary figures for 2006 were compiled from information gathered on the EENDR questionnaires sent to individuals who received doctoral degrees in the mathematical sciences during the 2005–2006 academic year from universities in the United States (see previous section for more details).

The questionnaires were distributed to 1,209 recipients of degrees using addresses provided by the departments granting the degrees; 660

individuals responded between late October and April. Responses with insufficient data or from individuals who indicated they had part-time or non-U.S. employment were excluded. Numbers of usable responses for each salary category are reported in the following tables.

Readers should be warned that the data in this report are obtained from a self-selected sample, and inferences from them may not be representative of the population.

Key to Tables and Graphs. Salaries are those reported for the fall immediately following the survey cycle. Years listed denote the survey cycle in which the doctorate was received: for example: survey cycle July 1, 2005-June 30, 2006, is designated as 2006. Salaries reported as 9-10 months exclude stipends for summer grants or summer teaching or the equivalent. M and F are male and female respectively. Male and female figures are not provided when the number of salaries available for analysis in a particular category was five or fewer. All categories of "Teaching/Teaching and Research" and "Research Only" contain those recipients employed at academic institutions only.

Graphs. The graphs show standard boxplots summarizing salary distribution information for the years 1999 through 2006. Values plotted for 1999 through 2005 are converted to 2006 dollars using the implicit price deflator prepared annually by the Bureau of Economic Analysis, U.S. Department of Commerce. These categories are based on work activities reported in EENDR. Salaries of postdoctorates are shown separately. They are also included in other academic categories with matching work activities.

For each boxplot the box shows the first quartile (Q1), the median (M), and the third quartile (Q3). The interquartile range (IQR) is defined as Q3-Q1. Think of constructing invisible fences 1.5×IQR below Q1 and 1.5×IQR above Q3. Whiskers are drawn from Q3 to the largest observation that falls below the upper invisible fence and from O1 to the smallest observation that falls above the lower invisible fence. Think of constructing two more invisible fences, each falling 1.5×IQR above or below the existing invisible fences. Any observation that falls between the fences on each end of the boxplots is called an outlier and is plotted as \circ in the boxplots. Any observation that falls outside of both fences either above or below the box in the boxplot is called an extreme outlier and is marked as * in the boxplot.

Acknowledgments

The Annual Survey attempts to provide an accurate appraisal and analysis of various aspects of the academic mathematical sciences scene for the use and benefit of the community and for filling the

Definitions of the Groups

As has been the case for a number of years, much of the data in these reports is presented for departments divided into groups according to several characteristics, the principal one being the highest degree offered in the mathematical sciences. Doctoral-granting departments of mathematics are further subdivided according to their ranking of "scholarly quality of program faculty" as reported in the 1995 publication *Research-Doctorate Programs in the United States: Continuity and Change.* ¹ These rankings update those reported in a previous study published in 1982. ² Consequently, the departments which now comprise Groups I, II, and III differ significantly from those used prior to the 1996 survey.

The subdivision of the Group I institutions into Group I Public and Group I Private was newfor the 1996 survey. With the increase in number of the Group I departments from 39 to 48, the Data Committee judged that a further subdivision of public and private would provide more meaningful reporting of the data for these departments.

Brief descriptions of the groupings are as follows:

- Group I is composed of 48 doctoral-granting departments with scores in the 3.00–5.00 range. Group I Public and Group I Private are Group I doctoral-granting departments at public institutions and private institutions respectively.
- Group II is composed of 56 doctoral-granting departments with scores in the 2.00–2.99 range.
- Group III contains the remaining U.S. doctoral-granting departments, including a number of departments not included in the 1995 ranking of program faculty.
- Group IV contains U.S. doctoral-granting departments (or programs) of statistics, biostatistics, and biometrics reporting a doctoral program.
- Group V contains U.S. doctoral-granting departments (or programs) of applied mathematics/applied science, operations research, and management science.
- Group Va is applied mathematics/applied science doctoralgranting departments; Group Vb, which is no longer surveyed as of 1998–99, was operations research and management science.
- Group M or Master's contains U.S. departments granting a master's degree as the highest graduate degree.
- Group B or Bachelor's contains U.S. departments granting a baccalaureate degree only.
- Listings of the actual departments which comprise these groups are available on the AMS website at www.ams.org/outreach.

information needs of the professional organizations. Every year, college and university departments in the United States are invited to respond. The Annual Survey relies heavily on the conscientious efforts of the dedicated staff members of these departments for the quality of its information. On behalf of the Data Committee and the Annual Survey Staff, we thank the many secretarial and administrative staff members in the mathematical sciences departments for their cooperation and assistance in responding to the survey questionnaires.

Doctoral Degrees Conferred 2005-2006

Supplementary List

The following list supplements the list of thesis titles published in the February 2007 *Notices*, pages 277–97.

CALIFORNIA

University of California, Davis (4)

STATISTICS

Kerr, Joshua, Signal extraction for seismic array data via partially linear least-squares.

Wu, Ping-Shi, Time-dynamic density estimation and functional discrimination for high-dimensional data.

Zhang, Ying, Time-varying functional regression models for time-to-event.

University of California, Irvine (4)

MATHEMATICS

 $Akhmedov, Anar, {\tt Smooth\,Structures\,on\,4-manifolds\,with\,small\,Euler\,characteristics}.$

Beyaz, Ahmet, A new construction of spin smooth 6-manifolds.

Haessig, Douglas, On the symmetric power of the P-adic D-airy family.

Zhao, Rui, Computational studies of morphogen gradients.

University of California, Riverside

(2)

STATISTICS

Kwon, Soonil, Spatial discrete choice models for multinomial respones.

Zainal, Mohammad, Skew-normal distribution with a cauchy skewing function.

IOWA

Iowa State University (4)

MATHEMATICS

 $\ensuremath{\textit{Alm, Jeremy}}$, Weak representation theory in the calculus of relations.

Kim, Joohyung, Classification of small class association schemes coming from certain combinatorial objects.

Meyer, Kristen, A new message authentication code based on the non-associativity of quasigroups.

Rajaram, Rajeev, Exact boundary controllability results for sandwich beam systems.

KENTUCKY

University of Kentucky (4)

STATISTICS

Bush, Heather, Khatri-Rao products and conditions for the uniqueness of PARAFAC solutions for 1xJxK arrays.

 ${\it Chen, Min}, Some \ contributions \ to \ the \ empirical \ likelihood \ method.}$

Tarima, Sergey, Consistency and generalization error bound of feed-forward neutral network trained with smoothing regularizer.

Liu, Chengan, Some sequential and two-stage procedures for selecting the best of treatments in clincial trials.

MARYLAND

University of Maryland, Baltimore County (6)

MATHEMATICS AND STATISTICS

Bebu, Ionut, Some statistical and probabilistic problems in Markov chains.

 ${\it Gavrea, Bogdan}, Simulation of rigid body system with joints, contact and friction.}$

Li, Cao, The assessment of multivariate bioequivalence.

Liu, Guohui, Sequential designs for logistic phase-I clinical trials.

Wu, Yanping, Topics in univariate bioequivalence testing. Zhang, Lanju, Response-adaptive randomization in clinical trials with continuous and survival time outcomes.

MASSACHUSETTS

Tufts University (1)

MATHEMATICS

Finn, Lucas, A variational approach to vortex core identification.

MICHIGAN

Western Michigan University (2)

STATISTICS

Ratanaruamkarn, Sauwanit, New estimates of a circular median.

Scherzer, Rebecca, Testing procedures for group sequential clinical trials with multiple survial endpoints.

NEW JERSEY

Princeton University (8)

PROGRAM IN APPLIED COMPUTATIONAL MATHEMATICS

Anthoine, Sandrine, Different wavelet-based approaches for the separation of noisy and blurred mixtures of components. Application to Astrophyical data.

Frierson, Dargan, Studies of the moist general circulation with a simplified moist GCM.

Gerber, Edwin, A dynamical and statistical understanding of the North Atlantic oscillation and annual modes.

Golden, Cliona, Spatio-temporal methods in the analysis of fMRI data in neuroscience.

Leslie, Nandi, Spatial stochastic models for landscape degrading and deforestation in Bolivia and Brazil.

Rustamov, Raif, On Heegard Floer homology of three-manifolds.

Sharp, Richard, Computational methods inspired by chemistry: multiscale modeling and mechanics of control.

Zou, Jing, Sublinear algorithms for the Fourier transform of signals with very few Fourier modes: theory, implementations, and applications.

NEW York

Cornell University (2)

BIOMETRICS UNIT

Denogean, Lisa Renee, Improved approximations of the density functions of estimators in population genetics.

 ${\it Long, Yu, } \ Bayesian \ Analysis of Levy processes \ with financial applications.$

OHIO

Case Western Reserve University (6)

EPIDEMIOLOGY AND BIOSTATISTICS

Campbell, Robert, Burden of disease amongst Carolina lupis patients: economic, humanistic, and clinical factors.

Davidson, Carrie, Efficiency, quality and costs in Ohio nursing homes.

Diggs, Jessica, The impact of medicaid outreach initiatives on the health and healthcare access of children in Ohio.

Mascha, Edward, Assessing individual treatment effect heterogeneity for binary outcomes.

Schumacher, Fredrick Ray, Relation between selenoprotein gene, selenium, and prostate cancer.

Wang, Tao, Extensions of Haseman-Elstron regression for linkage analysis.

SOUTH CAROLINA

University of South Carolina (3)

STATISTICS

Han, Jun, Parametric latent class joint model for longitudinal markers and recurrent events.

Parody, Robert, Simultaneous inference on the improvement in response surfaces.

Vera, Francisco, General convex stochastic orderings and related martingale-type structures.

VIRGINA

Virgina Tech (8)

STATISTICS

Chen, Younan, Bayesian hierarchical modeling on dual response surfaces.

Duan, Yuyan, A modified Bayesian power prior approach with applications in water quality evaluation.

Eisenbies, Penelop, Bayesian hierarchical methods and use of ecological thresholds and changepoints for habitat selection models.

Jensen, Willis, Profile monitoring for mixed model data.

Modarres-Mousavi, Shabnam, Monitoring Markov dependent binary observations with a log-likelihood ratio base CUSUM control chart.

Sego, Landon, Applications of control charts in medicine and epidemiology.

Yan, Mingjin, Methods of determining the number of clusters in a data set and a new clustering criterion.

Zhong, Xin, Efficient sampling plans for control charts when monitoring an autocorelated process.

WISCONSIN

University of Wisconsin, Madison (9)

STATISTICS

Monuz, Alendro, On approximate p-values for time series outlier detection.

Peng, Limin, Contributions to semi-completing risks data.

Song, Qinghua, Contributions to regression and classification tree methods.

Wang, Lin, Imputation methods for non-monotone nonignorable missing data in logitudinal studies.

Xie, *Xianhong*, Smoothing in magnetic resource image analysis and a hybrid loss for support vector machine.

Yang, Hyuna, Model-based clustering of genomic observiations: generalizing the instability selection network model.

 ${\it Yan, Ping,} \ {\it Bayesian cluster modeling for space-time disease counts}.$

Yue, Wei, Multi-resolution tree-structured spatial models.

Lu, Yuefeng, Contributions to functional data analysis with biological applications.

University of Wisconsin, Milwaukee
