**Kevin McGoff\*** ([kmcgoff1@uncc.edu](mailto:kmcgoff1@uncc.edu)). *Pressure and escape rates for random subshifts of finite type*. Preliminary report.

This talk concerns aspects of the thermodynamic formalism in a randomized setting. Let  $X$  be a non-trivial mixing shift of finite type, and let  $f : X \rightarrow \mathbb{R}$  be a Hölder continuous potential with associated Gibbs measure  $\mu$ . Further, fix a parameter  $\alpha \in (0, 1)$ . For each  $n \geq 1$ , let  $\mathcal{F}_n$  be a random subset of words of length  $n$ , where each word of length  $n$  that appears in  $X$  is included in  $\mathcal{F}_n$  with probability  $1 - \alpha$ , independently of all other words. Then let  $Y_n = Y(\mathcal{F}_n)$  be the random subshift of finite type obtained by forbidding the words in  $\mathcal{F}_n$  from  $X$ . In our first result, for  $\alpha$  sufficiently close to 1 and  $n$  tending to infinity, we show that the pressure of  $f$  on  $Y_n$  converges in probability to the value  $P_X(f) + \log(\alpha)$ , where  $P_X(f)$  is the pressure of  $f$  on  $X$ . Additionally, let  $H_n = H(\mathcal{F}_n)$  be the random hole in  $X$  consisting of the union of the cylinder sets of the words in  $\mathcal{F}_n$ . In our second result, for  $\alpha$  sufficiently close to one and  $n$  tending to infinity, we show that the escape rate of  $\mu$ -mass through  $H_n$  converges in probability to the value  $-\log(\alpha)$  as  $n$  tends to infinity.
